1 EXECUTIVE SUMMARY

TechAir Venture is a student-run impact investment fund focused on early-stage decarbonization deeptech startups. The fund aims to finance technologies that reduce, avoid, or capture greenhouse gas emissions by providing solutions in energy efficiency, carbon capture, and alternative fuels. These solutions are targeted at high-emission sectors such as energy, materials, buildings, transport, and industrial processes, where decarbonization needs are the most urgent.

The fund targets a total size of CHF 500,000, with CHF 200,000 already raised from the GP team and close LP network. The remaining CHF 300,000 is expected from 7 to 10 investment committee investors, each contributing approximately CHF 30,000 to CHF 50,000. TechAir plans to invest in four to five validated early-stage startups, with ticket sizes of CHF 75,000 to CHF 100,000, primarily through post-money SAFEs. This concentrated portfolio allows the fund to provide meaningful financial and strategic support to each company while keeping the investment structure simple and founder-friendly.

TechAir is rooted in the EPFL innovation ecosystem and connected to the broader Swiss climate-tech network. Each investment is assessed through financial, technical, and impact due diligence. After investment, portfolio companies receive support in fundraising, financial modelling, market research, impact KPI tracking, and access to EPFL's academic and entrepreneurial network.

Impact measurement is central to the fund's strategy. Each company must demonstrate a credible lifecycle emissions reduction through an LCA-based net benefit approach. Portfolio impact is monitored through three key indicators: greenhouse gas impact efficiency, cost per ton of emissions avoided, and technology-specific resource intensity.

The fund targets approximately 2.0x net MOIC, with an 8 to 10 year exit horizon reflecting the longer development cycles of decarbonization deeptech. With a 1% annual management fee, 15% carried interest with an impact-linked component, and a European-style waterfall, TechAir aligns financial performance with measurable decarbonization impact. Overall, the fund offers LPs the opportunity to support climate innovation while pursuing long-term financial and environmental value.

2 INTRODUCTION

Market Urgency

The Need for Decarbonization Solutions

Climate change has become one of the defining emergencies of our time. Human activities, mainly through greenhouse gas emissions, have already warmed the planet by around 1.35°C above pre-industrial levels in 2024 (NOAA). At the same time, global GHG emissions reached a record 53.2 GtCO₂e in 2024 (European Commission), driven by the continued carbon intensity of energy, industry, transport, buildings, and agriculture.

The most pressing issues the world will face in coming years are linked to resilient infrastructure, sustainable energy, biotech, and AI. These fields thrive on innovation and growth, and require investments that support their long-term vision for long-lasting transformation.

Decarbonization therefore requires deeptech solutions: technologies grounded in advanced science, able to overcome technological barriers and transform high-emission sectors. Deeptech startups are particularly relevant because they connect research to the market, develop high-barrier innovations, and can help industrialize the technologies still needed for carbon neutrality. By backing climate deeptech startups, TechAir Ventures aims to turn scientific innovation into measurable solutions that reduce, avoid, or capture emissions where the transition is most urgent.

Why EPFL

Ecole Polytechnique Federale de Lausanne is the backbone of the upcoming generation of innovative climate enthusiasts. By providing access to a variety of labs and worldclass education, EPFL has fostered an environment ripe for entrepreneurship. In fact, its Innogrant program dedicated to deep tech has awarded more than 200 grants, contributed to the creation of 150 startups, and supported projects that have raised more than CHF 1.8 billion in the last twenty years.

Why this Team

At TechAir, we gather a team of students who are directly involved in the EPFL startup ecosystem. As Master's students in the Sustainable Management and Technology program, we are on the frontlines of the fight for a more resilient world, and frequently work with companies in a variety of fields including energy, banking, manufacture and luxury. We also regroup a diverse set of backgrounds including engineering, economics, business, and psychology, and international perspective shaped by experience in Switzerland, Lebanon, France, Tunisia and Taiwan, offering a broad perspective on future investments.

3 FUND OVERVIEW

Impact Definition

In this report, we present TechAir Venture, a student-run impact investment fund focused on deeptech startups that contribute to decarbonization. We define impact investing as investing with the intention to generate measurable social and environmental impact alongside financial return, following the Global Impact Investing Network's definition. For our fund, impact means financing technologies whose core business directly helps reduce, avoid, or capture greenhouse gas emissions.

Our Mission

Our mission is to finance and support early-stage deeptech startups that accelerate decarbonization. As a student-run impact fund rooted in the EPFL ecosystem, TechAir Ventures aims to combine scientific rigor, venture discipline, and measurable climate impact.

Our Vision

Our vision is to build on EPFL's innovation ecosystem to support Switzerland's emergence as a leading launchpad for climate deeptech ventures. In the long term, we aim to help scientific breakthroughs become measurable decarbonization solutions for industries, cities, and communities.

Core Values

At TechAir Ventures, our core values shape how we invest, collaborate, and measure success. They reflect our commitment to using student-led capital and deeptech innovation to support credible decarbonization solutions.

Integrity means making decisions that are consistent with our values, responsibilities, and long-term objectives.

Integrity 01

Innovation 05

Innovation is a key driver of the climate transition. By leveraging deeptech and scientific expertise, we support solutions that can transform high-emission sectors and deliver measurable decarbonization impact.

02 Collective Responsibility

We believe the climate transition is a shared responsibility. Investors, entrepreneurs, researchers, and institutions all have a role to play in directing capital toward solutions that serve the common good.

Sustainability 04

Long-term value must align with environmental responsibility. Sustainability guides how we assess opportunities, risks, and each investment's contribution to decarbonization.

03 Transparency

Trust requires openness. We are committed to being clear about our investment decisions, financial assumptions, impact objectives, results, and limitations.

Investment Thesis

Driving Innovation for a Sustainable Future

Decarbonization as the Core Priority

The transition to a low-carbon economy depends on **decarbonization**. For our fund, this means **reducing future greenhouse gas emissions** and **removing or capturing existing emissions** when reduction alone is not enough.

Focus Area

We focus on decarbonization solutions in **energy efficiency, carbon capture, and alternative fuels**, targeting high-emission sectors such as energy systems, materials, buildings, transport, and industrial processes where deeptech can create meaningful climate impact.

Impact and Commercial Alignment

We prioritize companies where **commercial growth and climate impact reinforce each other**: as the company scales, its decarbonization impact increases.

Market Opportunity

Our thesis is that **regulatory pressure, corporate climate commitments, and consumer demand** will increase the need for scalable decarbonization solutions. We focus on startups whose core technology can deliver **measurable emissions reduction** while building commercially viable products.

SDG Alignment

This thesis aligns primarily with **SDG 13: Climate Action**, while also contributing to **SDG 7: Affordable and Clean Energy**, **SDG 9: Industry, Innovation and Infrastructure**, and **SDG 12: Responsible Consumption and Production**.

Our investment decisions remain grounded in one focused objective: financing deeptech solutions that can materially contribute to decarbonization.

Strategy and Scope

Strategic Approach to Climate Tech Innovation

Investment Target

TechAir Ventures invests in validated **early-stage decarbonization deeptech startups**, mainly at the pre-seed and seed stage. Target companies should have a clear link to the EPFL ecosystem, through a lab, grant, accelerator, research program, spin-off status, or other form of technical or entrepreneurial validation.

Investment Objective

Our objective is to combine disciplined **long-term financial returns** with **measurable climate impact**. Each investment must be assessed through both a financial and impact lens.

Selection process

Before investing, we conduct **financial analysis, technical due diligence, and impact assessment** to evaluate each startup's commercial potential, technological credibility, and contribution to decarbonization.

4 FUND MANAGEMENT

How We Interact

Active support after investment

TechAir acts as an active but lightweight investor. After investment, each portfolio company is assigned a small student support team that serves as the main point of contact with the fund. Through regular progress reviews, the team tracks key milestones, identifies support needs, and coordinates targeted projects in areas such as fundraising, market validation, financial planning, or impact reporting.

The goal is to provide practical support without overburdening founders, especially given the long development cycles, technical uncertainty, and financing needs of early-stage decarbonization deeptech startups.

How We Create Value

Technical, commercial, and impact support

TechAir's value creation model is based on five areas of support: technical expertise, business analysis, financial preparation, impact management, and ecosystem leverage.

Since portfolio companies are rooted in or connected to the EPFL ecosystem, TechAir helps them access relevant resources, including researchers, labs, professors, alumni, co-investors, corporates, and technical talent. Student teams will also support startups with market research, competitor analysis, customer discovery, fundraising materials, financial models, and impact KPI tracking.

This allows the fund to add value beyond its financial investment. Even with relatively small ticket sizes, TechAir can support portfolio companies through structured assistance and targeted network activation.

Key Risks and Mitigants

TechAir's main risks reflect the nature of early-stage decarbonization deeptech: long development cycles, technical uncertainty, high capital needs, and uncertain market adoption. The fund also faces concentration risk, with only four to five portfolio companies, and exit risk, as liquidity depends on later financing rounds, secondary sales, or strategic acquisitions.

To mitigate these risks, TechAir invests only in startups with initial EPFL-linked validation, such as a lab connection, grant, accelerator program, spin-off status, proof of concept, prototype, or early pilot. Each investment is assessed through financial, technical, and impact due diligence, focusing on market need, technological credibility, capital requirements, and measurable decarbonization potential.

After investment, TechAir monitors runway, technical milestones, commercial progress, fundraising needs, and impact KPIs through quarterly updates. Impact risk is managed through an LCA-based net benefit approach and three core indicators: GHG impact efficiency, cost per ton avoided, and technology-specific resource intensity.

Target Returns

TechAir targets venture-style returns through a concentrated portfolio of climate deeptech startups. The fund aims for approximately 2.0x net MOIC over the fund lifecycle, meaning LPs would target around CHF 2 returned for every CHF 1 invested after fees and carried interest.

Because early-stage climate investing is high-risk and illiquid, returns are expected to depend on a limited number of strong-performing companies. The concentrated structure allows the fund to dedicate closer monitoring, strategic support, and ecosystem access to each portfolio company.

Exit Strategy

TechAir Ventures adopts a long-term exit horizon of **8–10 years, with the possibility of a 1–2 year extension given the longer development cycles of climate deeptech.** Exits are expected primarily through strategic acquisitions, secondary share sales, or later-stage financing rounds.

Potential acquirers may include industrial groups, energy companies, climate-tech platforms, and larger technology firms seeking advanced decarbonization solutions. Secondary sales to later-stage investors may also provide liquidity when portfolio companies raise larger rounds. The fund should avoid selling to buyers who would likely shut down or weaken the company's impact mission.

Given our concentrated portfolio, each exit will have a meaningful impact on fund performance. For this reason, we prioritize disciplined investment selection, active monitoring, and companies with a credible path toward both commercial scale and measurable climate impact.

Portfolio Monitoring & Reporting

"Useful but Light" Monitoring Model

To strike a balance between rigorous impact oversight and the operational agility required by early-stage founders, we adopt a "useful but light" portfolio management model. Rather than seeking excessive control, the fund targets specific structural rights, including information rights, observer rights, and impact reporting rights.

To avoid overburdening entrepreneurs, each portfolio company agrees on only one or two priority support areas per year. This disciplined approach allows the fund to identify operational bottlenecks early, allocate follow-on capital selectively, and actively preserve leadership and operational continuity when student founders graduate.

The Tiered Reporting Cycle

Our oversight framework relies on a structured, tiered reporting cadence designed to capture real-time operational data while providing comprehensive disclosures to our investors.

Quarterly Portfolio Reporting (GP Level):

Portfolio companies submit comprehensive updates and raw impact data to the GP every quarter. This reporting covers core financial and operational dimensions:

- Cash position and runway
- Commercial milestones and technical progress
- Hiring needs and fundraising plans
- Impact KPI performance and major risks

This frequency enables the GP to monitor technical milestones in real-time and provide immediate strategic support if a company deviates from its projected impact trajectory.

Semi-Annual LP Reports (Investor Level):

Every six months, LPs receive an aggregated Impact Performance Report. This document synthesizes portfolio-wide progress, directly linking technical milestones to our long-term climate objectives. To ensure transparency, each report explicitly covers:

- **Portfolio-Level Overview:** Portfolio-level impact summaries and total fund-attributable impact
- **Company-Level Performance:** Company-level primary KPIs, progress against annual targets, and localized SDG mapping
- **Financial Integration:** Monetized impact estimates and underlying methodologies/assumptions
- **Risk & Accountability:** Documented cases where impact targets were missed, identified negative externalities or impact risks, and the corresponding corrective actions taken

Transparency Regarding Data Uncertainty

We remain explicitly transparent about the inherent uncertainties in early-stage impact modeling. In the deep-tech sector—where many products are still in the pilot or early-commercialization phase—environmental and operational data is naturally iterative.

To address this, our reports will clearly disclose the "confidence levels" of our measurements rather than presenting absolute conclusions. This rigorous standard ensures our LPs have a realistic, honest, and scientifically grounded view of the portfolio's ongoing impact maturity.

GP Compensation & Covenants

GP compensation is based on two elements: management fees, which cover fund operating costs, and carried interest, which rewards GPs with a share of realized fund profits. Carried interest is defined as the percentage of realized fund profit, above a carry basis, paid to the GP.

1% Annual Management Fee

We propose a **1% annual management fee** on committed capital, used only for legal costs, due diligence, reporting, and impact measurement.

European Waterfall

The fund would use a European-style whole-fund waterfall, meaning GPs receive carry only after LPs recover their committed capital. This is more LP-friendly than deal-by-deal carry and helps build trust with LPs.

15% Carrying interest

We propose a **15% carry**, below the standard 20%, to reflect our student-led structure while preserving performance incentives, calculated on committed capital to ensure LPs first recover their full commitment. Of this carry, **5% would be impact-linked** and paid only if portfolio-level decarbonization targets are met. To preserve upside incentives, carry could increase to 18% only if the fund significantly exceeds both financial and impact targets.

Covenants

LPs receive semi-annual reports covering financial performance, portfolio progress, company KPIs, monetized impact, missed targets, negative externalities, and corrective actions. The fund also commits to core covenants: no investment outside the decarbonization thesis, no investment without an impact KPI, no undisclosed methodology changes, and transparent disclosure of major risks or conflicts of interest.

5 PORTFOLIO OVERVIEW

Financial Instruments

TechAir Ventures will primarily invest in **early-stage decarbonization deeptech** startups, mainly at the **pre-seed and seed stage**. These companies should already show initial technical validation, such as an EPFL affiliation, a proof of concept, a prototype, or early pilot results, but may not yet be ready for a fully priced equity round.

Our preferred instrument is a **post-money SAFE**. It allows us to invest before a priced round and convert into equity at a future financing event, while reducing legal, valuation, and administrative complexity for both the fund and founders. The SAFE would include a valuation cap and, where relevant, a discount, to compensate TechAir for investing early and taking higher risk.

For structured **bridge rounds**, TechAir will use **convertible notes** when they are the standard instrument of the round. For **priced Seed rounds**, TechAir will invest through **preferred equity** alongside experienced lead investors and follow standard protections, including **broad-based weighted-average anti-dilution** where applicable.

Across all instruments, TechAir will require **information rights** and **impact reporting rights** to monitor financial progress and decarbonization KPIs. For larger tickets, TechAir will also request **pro-rata rights** to maintain its ownership in future rounds. Given the fund's ticket size, TechAir will not require board seats, but will target **observer rights** when the investment size or support role justifies closer involvement.

This structure keeps TechAir founder-friendly while protecting LP interests and ensuring that the fund can monitor both financial progress and measurable decarbonization impact.

Portfolio Construction

TechAir aims to maximize its impact by concentrating its capital and advisory resources in a limited number of high-potential startups, initially capped at four to five portfolio companies. This focused approach enables the fund to provide meaningful strategic support to each venture while maintaining the efficiency and quality of its consulting efforts.

The fund has already raised CHF 200,000 from GPs and GPs' Families, and it plans to raise CHF 300,000 more from the investment committee, which will be allocated across the selected startups in the most effective manner possible. Limiting the number of investments also ensures that each company receives a sufficiently significant investment. This is particularly important in the deep-tech sector, where startups are highly capital-intensive, rely on advanced technologies and specialized machinery, and often require long development cycles before generating returns. **By deploying larger ticket sizes, TechAir can maintain a relevant and credible position in the companies it supports, allowing the fund to contribute more effectively to their long-term strategic direction**

TICKET SIZE

CHF 75-100K

ENERDRAPE EXAMPLE STARTUP

Founded in 2019 as an EPFL spin-off, Enerdrape has developed the world's first prefabricated geothermal panel technology capable of transforming underground infrastructure into renewable heating and cooling sources, thus reducing building energy consumption.

Enerdrape remains a private company and is currently at the Seed financing stage. In January 2024, it raised an additional CHF 1.3 million in Seed funding led by Swiss investors including Après-demain and Romande Energie,, bringing its total disclosed funding above CHF 2 million.

Enerdrape is particularly attractive for TechAir because it combines strong scientific defensibility, measurable environmental impact, and validation from reputable Swiss institutional and energy-sector investors, while still operating at an early enough stage for a student-led fund to participate meaningfully in its growth trajectory.

6 IMPACT MEASUREMENT

Impact Measurement Framework

Investment Qualification: The Impact Gatekeeper

To ensure the integrity of our climate returns, we establish a rigorous gatekeeping threshold for every potential investment. Given our focus on deep-tech innovations that drive decarbonization, the **LCA (Life Cycle Assessment) Net Benefit** serves as our primary filter. We mandate that a technology must demonstrate a substantial net reduction in emissions when analyzed across its entire lifecycle—from raw material extraction to end-of-life. If a technology cannot produce a significant net climate gain under this scientific scrutiny, we deem the company to lack the fundamental climate competitiveness required to enter our portfolio.

Impact Indicators

Impact assessment is the core of how we evaluate and drive the performance of our portfolio companies. To ensure our investments remain steadfast in their climate missions—and to prevent "mission drift" toward purely financial objectives—we have established a indicator framework that reflects each company's real-world contribution to decarbonization.

Given our focus on leveraging deep-tech to decarbonize society, we have selected three key indicators that provide a comprehensive view of a company's progress and sustainability:

Greenhouse Gas
Impact Efficiency

Cost per Ton of
Emissions Avoided

Technology-Specific
Resource Intensity

While the first two indicators provide us with a standardized way to benchmark performance across the portfolio, the third is designed as a defensive safeguard. It ensures that our path to net-zero adheres to the "Do No Significant Harm" (DNSH) principle, preventing progress in carbon reduction from causing unintended damage to other vital environmental dimensions.

Metric 1: Greenhouse Gas Impact Efficiency

This metric serves as the cornerstone of our fund's mission, quantifying the "Impact Multiplier" of our investments. It is defined by the following ratio:

$$\text{GHG Impact Efficiency} = \text{Total GHG Avoided} / \text{Firm's Scope 1 + 2 + 3 Emissions}$$

Unlike traditional metrics that only report gross emissions reduction, this ratio accounts for the "carbon cost" of the technology itself. By including the firm's full carbon footprint (Scope 1-3), we ensure that the externalities of manufacturing and operating deep-tech don't outweigh its environmental benefits.

We align our numerator with the IRIS+ framework to ensure global best practices. Additionally, we stay consistent with our LCA (Life Cycle Assessment) logic; we only count net-positive benefits that include all emissions generated throughout the technical process. Since different deep-tech sectors (e.g., DAC vs. SAF, as shown in the table below) have unique baselines, we collaborate with each portfolio company to define the most accurate and conservative methodology for their specific technology.

This indicator provides LPs with a transparent view of the "Climate ROI"—ensuring our capital is backing technologies that offer the highest leverage in the fight against climate change.

Firm Type Examples	Example of GHG Avoided Calculation
Prefabricated Geothermal	(Fossil-based Emissions - Geothermal Emissions) x Quantity
Direct Air Capture	Captured CO ₂ - (Energy Emissions + Sorbent Emissions + Storage Emissions)
Sustainable Aviation Fuel	(Jet A-1 Emissions - H ₂ LCA Emissions) x Quantity

Examples of GHG Avoided Calculation

Linking GHG Impact to Financial Value

To bridge the gap between climate contribution and financial performance, we translate GHG avoidance into a monetized impact value. By benchmarking against the EU ETS carbon price, we assess the market competitiveness of our technologies through the following metrics:

- **Monetized Impact Value** = Total GHG avoided × Average EU ETS carbon price at reporting period
- **Fund-attributable Impact Value** = Fund Ownership % × Monetized Impact Value
- **Impact-adjusted Value** = Financial Value Created + Monetized Impact Value or Fund-attributable Impact Value

These metrics supplement our non-monetized assessments, providing a holistic view of the portfolio's integrated financial and environmental performance.

Metric 2: Cost per Ton of GHG Avoided

Scalability is the bridge between a laboratory breakthrough and global impact. To ensure our deep-tech investments can achieve widespread deployment, we monitor the cost of technology per ton of GHG avoided as a key indicator of technical maturity and commercial readiness.

Cost per Ton of GHG Avoided = Total Cost of Technology / Total GHG Avoided

Using the company's total spending (including CAPEX and OPEX) divided by the tonnes of GHG removed, this metric allows us to benchmark the "Green Premium": the cost difference between a clean technology and its alternative. While it provides a standardized way to compare the financial feasibility of different technologies horizontally, our primary focus is on the improvement rate of individual companies.

By tracking this trajectory over a 10-year horizon, we ensure that the technology is rapidly evolving from a niche innovation into a cost-competitive, high-leverage solution capable of driving large-scale societal decarbonization.

Metric 3: Technology-Specific Resource Intensity

Deep-tech decarbonization often carries the risk of "burden shifting"—where solving for carbon emissions inadvertently increases environmental pressure elsewhere. To mitigate this, we adhere to the "Do No Significant Harm" (DNSH) principle. Our third metric serves as a strategic "environmental firewall", designed to monitor and minimize the specific ecological footprint of each portfolio company.

Because the risks associated with hydrogen differ fundamentally from those of battery storage, these indicators are bespoke to each firm's technical reality (see examples in the table below). This tailored approach allows us to manage material risks that generic metrics often miss.

While these metrics are less suited for horizontal comparison, they are vital for tracking an individual company's learning curve. We prioritize the year-over-year improvement in process efficiency, ensuring that as our companies scale, their consumption of vital resources—such as water, land, and critical minerals—declines relative to their output. This focus ensures that our investments are not only low-carbon but also fundamentally sustainable and resilient for the long term.

Examples of Resource Intensity Metrics

Firm Type Examples	Burden Shifting Risks	Examples of Related Indicators
Prefabricated Geothermal	Material Overuse	Material Intensity = Total Weight of Panel Material (tons) / Rated Thermal Output (kWth)
Direct Air Capture	Energy Penalty	Energy Intensity = Total Energy Input (GJ) / Captured CO ₂ (tCO ₂ e)
Hydrogen	Water stress	Water Intensity = Total Water Consumption (tons) / Total H ₂ Production (kg H ₂)
Alternative Fuel	Indirect Land Use Change	Land Footprint = Biomass Production Area (ha) / Net GHG Reduction (tCO ₂ e)
Energy Storage	Critical Mine Dependency	Mineral Intensity = Critical Mineral Weight (tons) / Total Storage Capacity (MW)

Impact Measurement Principles

To ensure impact integrity and drive continuous operational improvement, we have established a disciplined reporting framework. Our measurement process is designed to provide LPs with a transparent, evidence-based view of each company's progress through the following four principles:

- **A Balanced Scorecard (The 2+1 Rule):** All portfolio companies are mandated to report on the three core indicators previously defined. This ensures a holistic focus on both performance drivers (two positive impact metrics) and risk safeguards (one negative externality metric).
- **Baseline Benchmarking:** We establish quantitative baselines at the inception of every investment. These baselines allow us to accurately measure the rate of technological evolution and value creation.
- **Strategic Milestone Alignment:** Based on these baselines, companies must set ambitious yet realistic targets across three horizons: Short-term (3 years), Medium-term (5-7 years), and Long-term (the 10-year exit horizon). This ensures impact goals are fully integrated into the company's business plan.
- **Methodological Governance and Oversight:** While we allow for sector-specific nuances in calculation, all methodologies must undergo rigorous GP Approval. Any subsequent adjustments to reporting methodologies must be transparently documented and disclosed in our annual impact reports.

7 TIMELINE & MILESTONES

As a student-led fund, we proactively plan for the graduation and handover of our student GPs. To ensure operational continuity, our **Permanent Advisory Board** (PAB, comprised of EPFL faculty and seasoned climate tech investors) and a strong network of **senior TechAir alumni** serve as the vital link across student generations, supporting long-term fund success.

Year 1: 2026 Q2 – 2027 Q4

Fund Setup, Capital Raising, and Pipeline Scouting

- Structure the fund vehicle and onboard the Permanent Advisory Board (PAB) for long-term oversight
- Secure 200k CHF from GPs/families and raise the remaining 300k CHF from climate-conscious LPs
- Establish deal-flow pipelines via EPFL Innovation Park and campus accelerators
- Finalize the LCA-based impact assessment framework and embed initial gatekeeping rules

Years 4 – 7: 2030 Q1 – 2033 Q4

Portfolio Management, Scaling, and Risk Mitigation

- Review quarterly updates to identify and mitigate operational bottlenecks early
- Target 1–2 priority support areas per company annually to maximize resource efficiency
- Deliver Semi-Annual Reports featuring impact summaries, monetized carbon values, and missed-target mitigation logs
- Manage leadership and operational transitions when student founders graduate from EPFL to preserve institutional knowledge

Years 2 – 3: 2028 Q1 – 2029 Q4

Active Investment & Capital Deployment

- Screen EPFL startups via gatekeeping filters, investing 75k–100k CHF tickets into 4–6 high-potential deep-tech companies
- Conduct due diligence investigation and technical audits to establish baselines for impact indicators
- Ensure firms follow the periodic monitoring and reporting requirements
- Transition graduating GPs to alumni partners and leverage the PAB to unlock other Swiss fundings

Years 8 – 10: 2034 Q1 – 2036 Q4

Harvesting, Exits, and Fund Liquidation

- Activate the PAB and senior alumni to lead corporate M&A, neutralizing the active student cohort's inexperience
- Leverage 10-year technology learning curves to command premium M&A valuations
- Execute strategic divestments and distribute financial returns
- Issue the final audit quantifying cumulative climate impact, concluding all legal operations
